Assignment 4

Due at 11:59pm on November 5.

This is an individual assignment. Turn in this assignment as an HTML or PDF file to ELMS. Make sure to include the R Markdown or Quarto file that was used to generate it. Include the GitHub link for the repository containing these files.

GitHub link: https://github.com/gracedesj/727-Assignment-4

In this notebook we will use Google BigQuery, "Google's fully managed, petabyte scale, low cost analytics data warehouse". Some instruction on how to connect to Google BigQuery can be found here: https://db.rstudio.com/databases/big-query/.

You will need to set up a Google account with a project to be able to use this service. We will be using a public dataset that comes with 1 TB/mo of free processing on Google BigQuery. As long as you do not repeat the work in this notebook constantly, you should be fine with just the free tier.

Go to https://console.cloud.google.com and make sure you are logged in a non-university Google account. This may not work on a university G Suite account because of restrictions on those accounts. Create a new project by navigating to the dropdown menu at the top (it might say "Select a project") and selecting "New Project" in the window that pops up. Name it something useful.

After you have initialized a project, paste your project ID into the following chunk.

```
project <- "assignment-4-440616"
```

We will connect to a public database, the Chicago crime database, which has data on crime in Chicago.

```
con <- dbConnect(
  bigrquery::bigquery(),
  project = "bigquery-public-data",
  dataset = "chicago_crime",
  billing = project</pre>
```

```
)
con
```

<BigQueryConnection>

Dataset: bigquery-public-data.chicago_crime

Billing: assignment-4-440616

We can look at the available tables in this database using dbListTables.

Note: When you run this code, you will be sent to a browser and have to give Google permissions to Tidyverse API Packages. Make sure you select all to give access or else your code will not run.

```
dbListTables(con)
```

```
[1] "crime"
```

Information on the 'crime' table can be found here:

https://cloud.google.com/bigquery/public-data/chicago-crime-data

Write a first query that counts the number of rows of the 'crime' table in the year 2016. Use code chunks with $\{\text{sql connection} = \text{con}\}\$ in order to write SQL code within the document.

```
SELECT count(primary_type), count(*)
FROM crime
WHERE year = 2016
LIMIT 10;
```

Table 1: 1 records

f0_	f1_	
269922	269922	

Next, count the number of arrests grouped by primary_type in 2016. Note that is a somewhat similar task as above, with some adjustments on which rows should be considered. Sort the results, i.e. list the number of arrests in a descending order.

```
SELECT primary_type, COUNT(*) AS arrest_count
FROM crime
WHERE year = 2016 AND arrest = TRUE
GROUP BY primary_type
ORDER BY arrest_count DESC;
```

Table 2: Displaying records 1 - 10

primary_type	arrest_count
NARCOTICS	13327
BATTERY	10333
THEFT	6522
CRIMINAL TRESPASS	3724
ASSAULT	3492
OTHER OFFENSE	3415
WEAPONS VIOLATION	2511
CRIMINAL DAMAGE	1669
PUBLIC PEACE VIOLATION	1116
MOTOR VEHICLE THEFT	1098

We can also use the date for grouping. Count the number of arrests grouped by hour of the day in 2016. You can extract the latter information from date via EXTRACT (HOUR FROM date). Which time of the day is associated with the most arrests?

```
SELECT EXTRACT(HOUR FROM date) AS hour_of_day, COUNT(*) AS arrest_count
FROM crime
WHERE year = 2016 AND arrest = TRUE
GROUP BY hour_of_day
ORDER BY arrest_count DESC;
```

Table 3: Displaying records 1 - 10

hour_of_day	arrest_count
19	3843
18	3481
20	3302
21	2961
16	2933
22	2896

hour_of_day	arrest_count
11	2895
17	2820
12	2787
14	2774

The time of day that is associated with the most arrests is 19:00/7:00pm.

Focus only on HOMICIDE and count the number of arrests for this incident type, grouped by year. List the results in descending order.

```
SELECT year, COUNT(*) AS homicide_arrest_count
FROM crime
WHERE primary_type = 'HOMICIDE' AND arrest = TRUE
GROUP BY year
ORDER BY homicide_arrest_count DESC;
```

Table 4: Displaying records 1 - 10

year	homicide_arrest_count
2001	430
2002	427
2003	382
2020	349
2022	306
2004	294
2021	292
2016	289
2008	287
2006	284

Find out which districts have the highest numbers of arrests in 2015 and 2016. That is, count the number of arrests in 2015 and 2016, grouped by year and district. List the results in descending order.

```
SELECT year, district, COUNT(*) AS arrest_count
FROM crime
WHERE (year = 2015 OR year = 2016) AND arrest = TRUE
GROUP BY year, district
ORDER BY arrest_count DESC;
```

Table 5: Displaying records 1 - 10

year	district	arrest_count
2015	11	8974
2016	11	6575
2015	7	5549
2015	15	4514
2015	6	4474
2015	25	4450
2015	4	4325
2015	8	4113
2016	7	3655
2015	10	3622

Lets switch to writing queries from within R via the DBI package. Create a query object that counts the number of arrests grouped by primary_type of district 11 in year 2016. The results should be displayed in descending order.

Execute the query.

```
sql <-
"SELECT primary_type, COUNT(*) AS arrest_count
FROM crime
WHERE district = 11 AND year = 2016 AND arrest = TRUE
GROUP BY primary_type
ORDER BY arrest_count DESC;"

result <- dbGetQuery(con, sql)
print(result)</pre>
```

```
# A tibble: 27 \times 2
   primary_type
                                      arrest_count
   <chr>>
                                              <int>
1 NARCOTICS
                                               3634
2 BATTERY
                                                635
3 PROSTITUTION
                                                511
4 WEAPONS VIOLATION
                                                303
5 OTHER OFFENSE
                                                255
6 ASSAULT
                                                206
7 CRIMINAL TRESPASS
                                                205
8 PUBLIC PEACE VIOLATION
                                                135
```

```
9 INTERFERENCE WITH PUBLIC OFFICER 119
10 CRIMINAL DAMAGE 106
# i 17 more rows
```

Try to write the very same query, now using the dbplyr package. For this, you need to first map the crime table to a tibble object in R.

```
crime_tibble <- tbl(con, "crime")</pre>
str(crime_tibble)
List of 2
 $ src
            :List of 2
  ..$ con :Formal class 'BigQueryConnection' [package "bigrquery"] with 7 slots
  ..... @ project : chr "bigquery-public-data"
                        : chr "chicago_crime"
  .. .. ..@ dataset
  .....@ billing : chr "assignment-4-440616"
  .. .. .. @ use_legacy_sql: logi FALSE
  .. .. ..@ page_size : int 10000
  .. .. ..@ quiet
                        : logi NA
  .. .. ..@ bigint
                        : chr "integer"
  ..$ disco: NULL
  ..- attr(*, "class")= chr [1:4] "src_BigQueryConnection" "src_dbi" "src_sql" "src"
 $ lazy_query:List of 6
               : 'dbplyr_table_path' chr "`crime`"
  ..$ x
              : chr [1:22] "unique_key" "case_number" "date" "block" ...
  ..$ group_vars: chr(0)
  ..$ order_vars: NULL
  ..$ frame
              : NULL
  ..$ is_view : logi FALSE
```

..- attr(*, "class")= chr [1:3] "lazy_base_remote_query" "lazy_base_query" "lazy_query" - attr(*, "class")= chr [1:5] "tbl_BigQueryConnection" "tbl_dbi" "tbl_sql" "tbl_lazy" ...

```
class(crime_tibble)
```

```
[1] "tbl_BigQueryConnection" "tbl_dbi" "tbl_sql"
[4] "tbl_lazy" "tbl"
```

Again, count the number of arrests grouped by primary_type of district 11 in year 2016, now using dplyr syntax.

```
query2 <-
  crime_tibble %>%
  filter(year == 2016, district == 11, arrest == TRUE) %>%
  group_by(primary_type) %>%
  summarise(arrest_count = n()) %>%
  arrange(desc(arrest_count))

print(query2)
```

```
SQL [?? x 2]
# Source:
# Database:
              BigQueryConnection
# Ordered by: desc(arrest_count)
  primary_type
                                     arrest_count
   <chr>
                                            <int>
1 NARCOTTCS
                                             3634
2 BATTERY
                                              635
3 PROSTITUTION
                                              511
4 WEAPONS VIOLATION
                                              303
5 OTHER OFFENSE
                                              255
6 ASSAULT
                                              206
7 CRIMINAL TRESPASS
                                              205
8 PUBLIC PEACE VIOLATION
                                              135
9 INTERFERENCE WITH PUBLIC OFFICER
                                              119
10 CRIMINAL DAMAGE
                                              106
# i more rows
```

Count the number of arrests grouped by primary_type and year, still only for district 11. Arrange the result by year.

```
query3 <-
  crime_tibble %>%
  filter(district == 11, arrest == TRUE) %>%
  group_by(primary_type, year) %>%
  summarise(arrest_count = n(), .groups = 'drop') %>%
  arrange(year)

print(query3)
```

Source: SQL [?? x 3]

Database: BigQueryConnection

Ordered by: year

	<pre>primary_type</pre>	year	arrest_count
	<chr></chr>	<int></int>	<int></int>
1	OFFENSE INVOLVING CHILDREN	2001	44
2	HOMICIDE	2001	48
3	ROBBERY	2001	97
4	LIQUOR LAW VIOLATION	2001	49
5	INTERFERENCE WITH PUBLIC OFFICER	2001	14
6	KIDNAPPING	2001	4
7	CRIMINAL TRESPASS	2001	389
8	CRIMINAL DAMAGE	2001	163
9	SEX OFFENSE	2001	19
10	ASSAULT	2001	322
# :	i more rows		

Assign the results of the query above to a local R object.

```
query3_R_object <-
  crime_tibble %>%
  filter(district == 11, arrest == TRUE) %>%
  group_by(primary_type, year) %>%
  summarise(arrest_count = n(), .groups = 'drop') %>%
  arrange(year) %>%
  collect()
```

Confirm that you pulled the data to the local environment by displaying the first ten rows of the saved data set.

2	LIQUOR LAW VIOLATION	2001	49
3	HOMICIDE	2001	48
4	INTERFERENCE WITH PUBLIC OFFICER	2001	14
5	KIDNAPPING	2001	4
